

Acrome Smart Motion Device Controlling With AI

What is Acrome Smart Motion Device?

Smart Motion Devices are advanced tools designed to facilitate the construction of multi-axis, daisy-chained robotic systems. These devices support a wide range of motor types, allowing for flexibility in robotic configurations to meet diverse application needs. Additionally, they are compatible with various add-on sensors, enabling precise data acquisition and enhanced control capabilities. Smart Motion Devices can seamlessly integrate with different types of master controllers, making them versatile solutions for building scalable, high-performance robotic systems tailored to industrial, research, or custom automation projects.

Figure 1: Smart Motion Device

What is the application and what does it do?

The Acrome Smart Motion Device enables users to control the device using artificial intelligence. It supports both text-based and voice commands, making it versatile and user-friendly. The system is highly flexible, as it can be controlled remotely via a Raspberry Pi.

Additionally, the device allows users to assist the robot in performing tasks simply by giving commands, without the need to write code. For example, by instructing the robot to move 5 cm, it will automatically move that exact distance.

In summary, the Acrome Smart Motion Device will enable users to control the robot easily in the future, without the need for any coding knowledge.

Steps of Application

First Step:

Enter Your API Key

Enter your API key here...

Save API Key

Figure 2: Api Key Screen

You must get api key from Groq Cloud. I will tell you how to get an API from Groq Cloud.

For Groq Cloud:

Visit the following site: [Groq API Documentation](#). First of all, you should login or register. When you were logged you will see console groq page. Then you can click on the Api Keys and you should create api key.

Second Step:

When you enter your api key, you will see main screen.

The screenshot shows a mobile application interface titled "Robot Control Assistant". It features a large text input area at the top with the placeholder text "Command me something about the robot...". Below this is a blue button labeled "Start Voice Recording". Underneath the button is another large text area with the placeholder text "Robot's response will appear here...". At the bottom of the screen, there is a small text label "Response time: 0.00 seconds" and a blue button labeled "Command".

Figure 3: Main Screen

Features:

- You can send input to Ai. Artificial intelligence processes the input. Then Ai sends the processed order to the robot and runs it.
- If the user wishes, by saying start audio recording and speaking and finally saying stop. It fills the input section. After that, the user can send the input by pressing the command button. In short, you can send commands by typing or speaking.

IMPORTANCE:

- If you deleted the api key from groq Cloud, please delete the api_key.txt file in the exe folder. Otherwise, the application will think that it exists and will give an error when it tries to run the artificial intelligence.
